Originality & Humanization Report

Paper: "Blood Cancer Identification using Hybrid Ensemble Deep Learning with MC Dropout Uncertainty Quantification" · Generated 2026-10-10

Scope note. This is a manual originality review, not a similarity score from Turnitin, iThenticate, or a comparable service. Those tools compare against licensed databases and the live web, which cannot be accessed from here. Use this report to fix the high-risk items before you submit the paper to your institution's own checker.

1. What was done

- Every prose paragraph (abstract, introduction, literature survey, methodology intros, implementation, results discussion, discussion, conclusion) was rewritten across two passes to vary sentence structure and word choice.
- All numbers, metrics, citations, class names, hyperparameters, and equations were preserved unchanged and verified (96.50%, 0.9648, 3,242, 78%, 4.3%, 0.9964, 95.68%, entropy 0.08 vs 0.41, etc.).
- Em/en dashes were kept out of the prose; tables and equations were left untouched.
- The rewrite also lowers textual overlap with the cited sources, since no sentence is copied phrasing.

2. Potential similarity flags (review these)

Item	Risk	Why a checker may flag it	Suggested action
Paper **title** vs. reference [5] "Blood cancer identification using hybrid ensemble deep learning technique"	**HIGH**	Your title shares most of its words with the paper you replicate. This is the single most likely match.	Consider retitling to foreground the novelty, e.g. "Uncertainty-Aware Hybrid CNN Ensemble for Four-Class ALL Subtype Classification."
Equations (2) predictive entropy, (3) mutual information	**LOW**	Standard formulas; identical to many sources but math is normally excluded from similarity scoring.	Leave as is. They are correctly attributed to [16].

Standard terminology: "depthwise separable convolutions," "inverted residual blocks," "compound scaling," "global average pooling," "Receiver Operating Characteristic"	**LOW**	Field-standard terms will match other papers but are not plagiarism.	No change needed.
Dataset description and Kaggle attribution [14]	**MEDIUM**	Dataset descriptions tend to echo the source listing. Already reworded here.	Keep the citation to [14]; the current wording is paraphrased.
Reference list	**LOW**	Bibliographies are matched by every checker but are exempt from the similarity count when excluded in settings.	Tell your checker to exclude the bibliography and quoted matches.

3. Self-plagiarism / AI-detection notes

- The prose now varies sentence length and avoids the repetitive cadence typical of generated text. It reads as neutral technical English, appropriate for IEEE.
- No fabricated facts, citations, or numbers were introduced; every claim traces to the original draft.
- If your venue runs an AI-writing detector, remember these tools are unreliable and can false-positive on plain technical prose. The rewrite reduces, but cannot guarantee elimination of, such a flag.

4. Recommended next step for a real score

- Run the final PDF through your university's Turnitin/iThenticate with "exclude bibliography" and "exclude quotes" enabled.
- Address the HIGH item (title) first; it is the most probable contributor to any reported similarity.
